

Viscerale aneurismer

DFIR 7. oktober 2021

Ruben Juhl Jensen

Overlæge Radiologisk afdeling RH

Inddeling

- Sande aneurismer
 - Pseudoaneurismer
 - Viscerale aneurismer
 - Renale aneurismer
 - Mykotisk aneurisme
 - Graviditet
 - HAA, SAA, RAA, SMAA...
 - HAPA, SAPA, RAPA...
 - VAA
 - RAA
- 
- VRAA

En sjælden sygdom

- Incicens VRAA 0,1-2%
- Omkring 5% af AA er VAA
- Ruptur ved debut
 - Sande: 20%
 - Falske: 70%
- RAA 0,1%
 - Sektion 0,01-0,09%
 - A-grafi 0,73-0,97%

Hvad siger guidelines?

- Rumperede aneurismer skal behandles med det samme
- Aneurismer hos gravide skal behandles uanset størrelse
- Mykotiske aneurismer skal behandles uanset størrelse

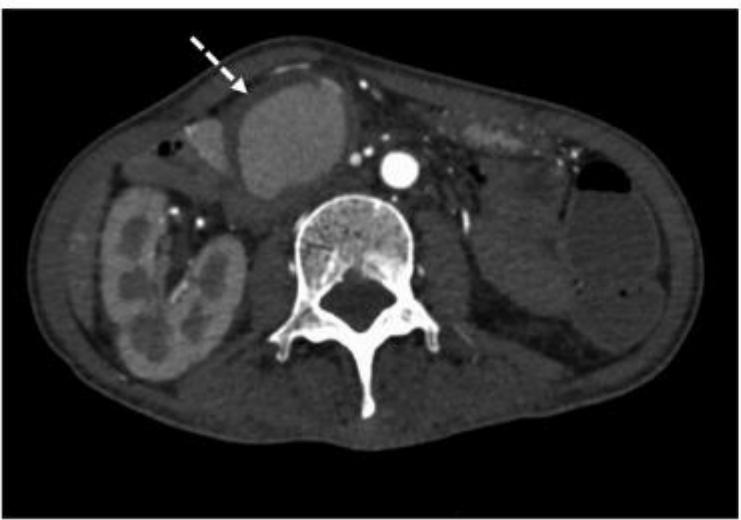

a

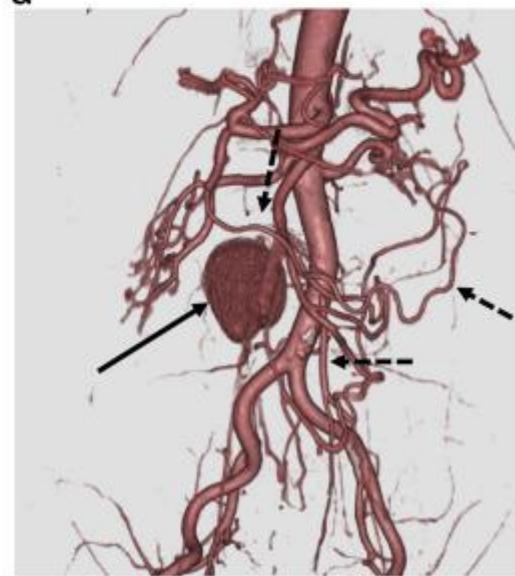

c

b

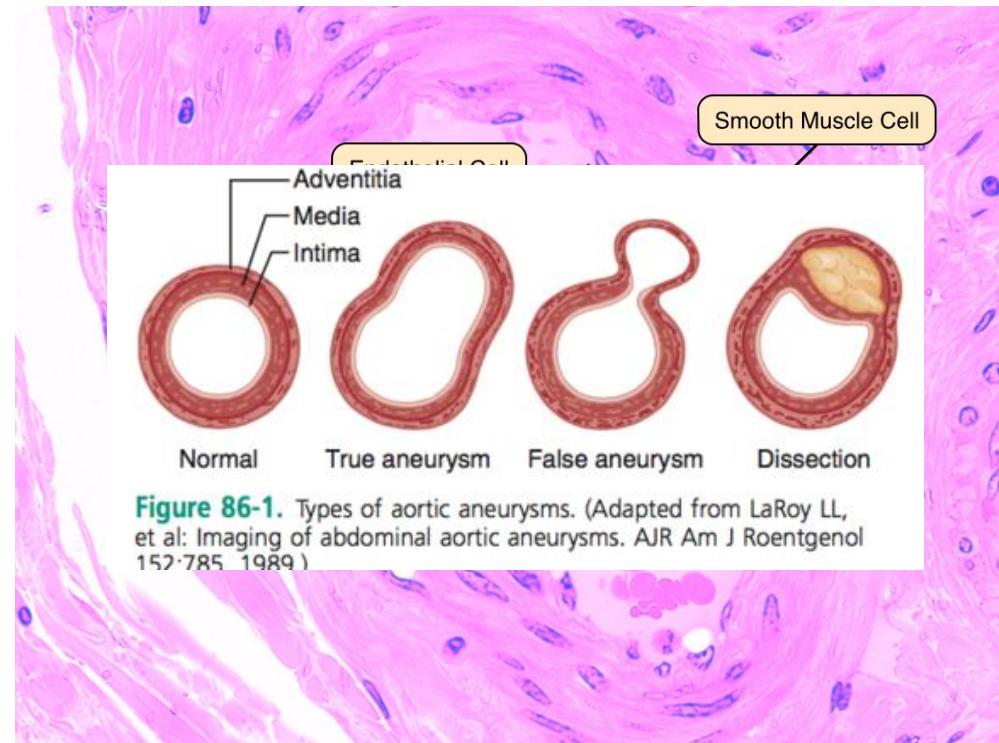

d

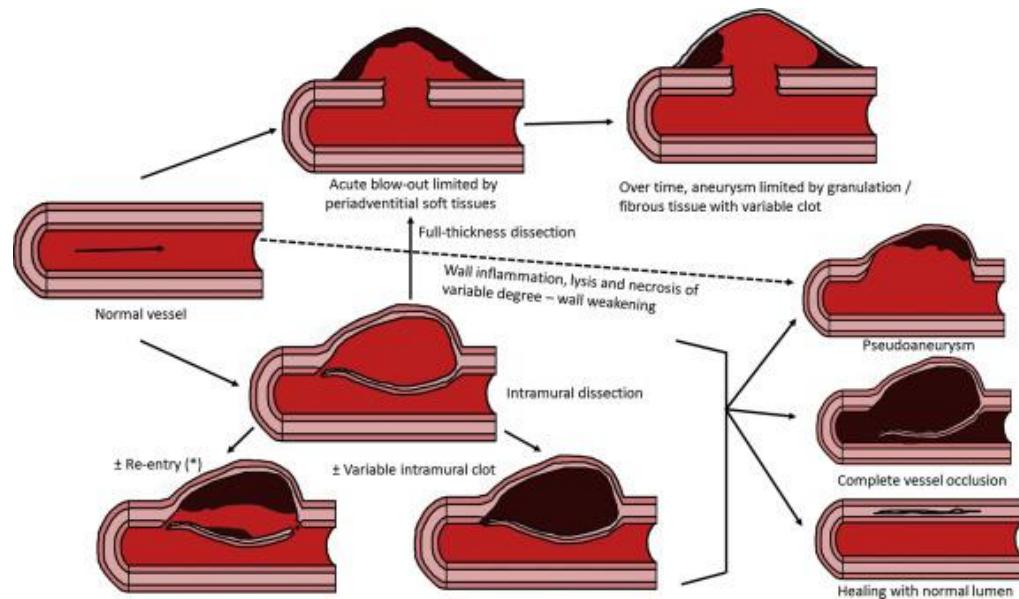

Pseudoaneurismer

- Mangler større eller mindre del af karvæggen
- Uforudsigelig vækstmønster
- Kan pludselig rumpere
- Behandles uanset størrelse
- Bør ikke "pakkes med coils"

Naturhistorie

- Traume/karskade
 - Stumpt/skarpt
 - Iatrogen
 - Knive
 - Nåle
- Infektion
 - Pancreatitis
 - Endocarditis

Post operativt PA pancreaticoduodenale arkade

Postoperativ PA Embolisering under aktiv blødning

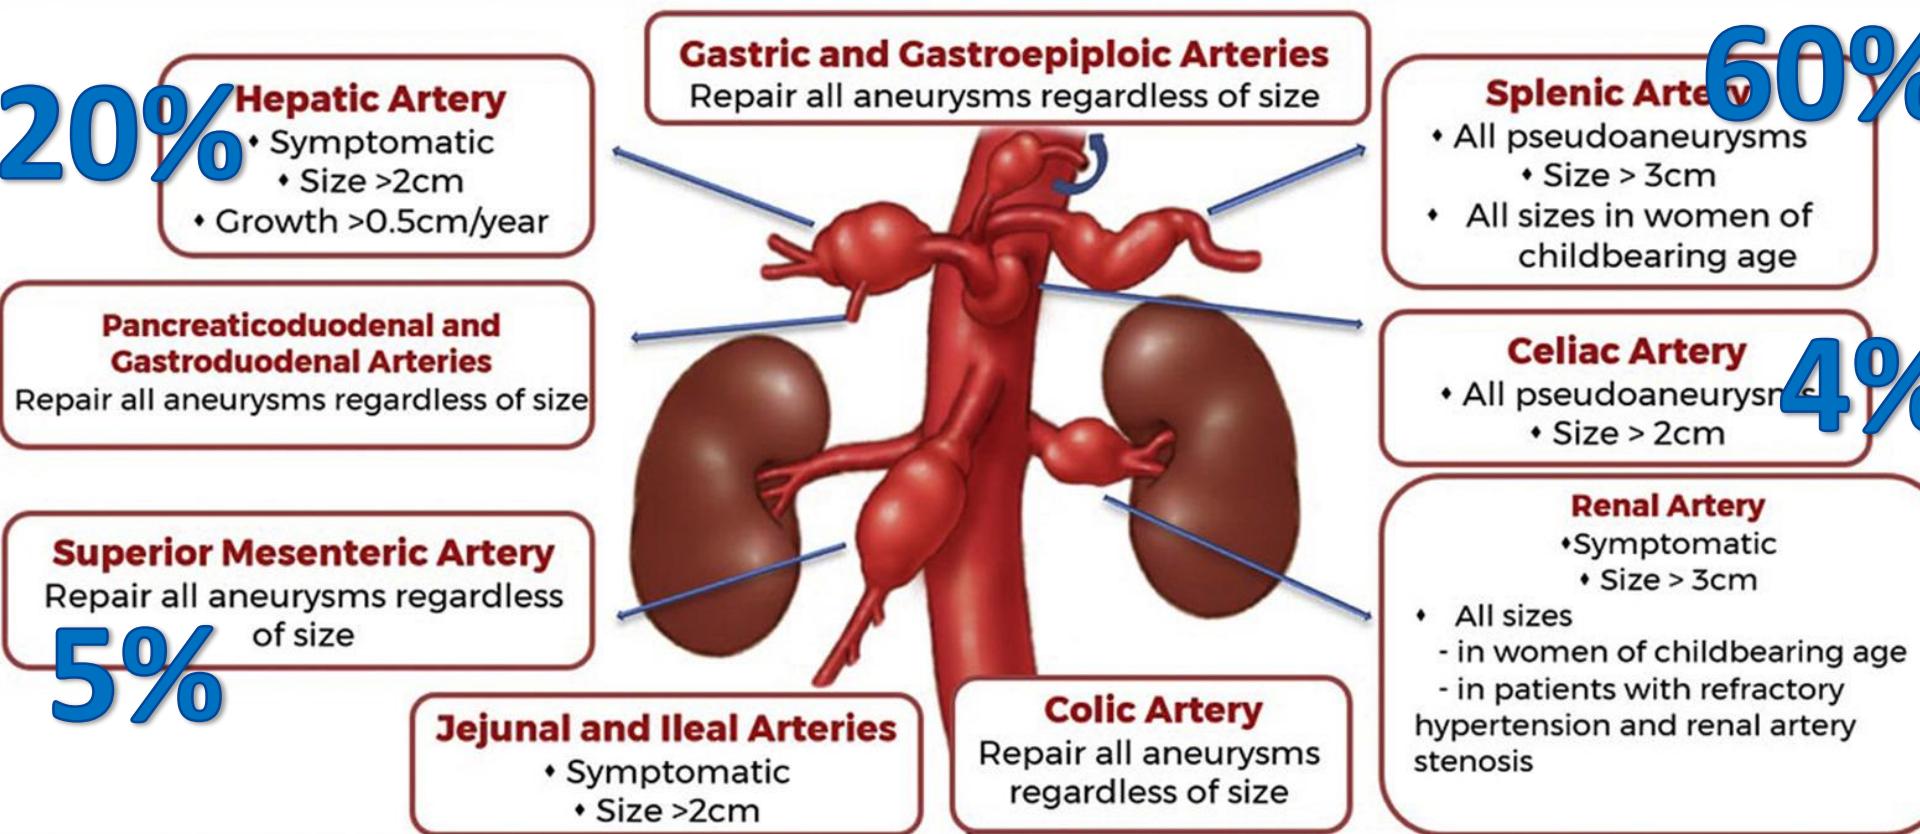

Sande aneurismer

- Degenerative/atherosklerotiske
 - Tab glatte muskelceller, brud på elastiske fibre
- Fibromuskulær dysplasi
- Arvelige
 - Marfan-, Ehlers-Danlos syndrom
- Aortaaneurismer
 - Diastolisk BT > 100 mmHg
 - Rygning => øget protease aktivitet hos nogen

SVS guidelines 2020

80 studier - 2845 aneurismer

SVS Clinical Practice Guidelines on the Management of Visceral Aneurysms

Miltarterieaneurismer

SVS 2020 - 775 SAA

2. Treatment indications, size criteria, and true vs false aneurysms

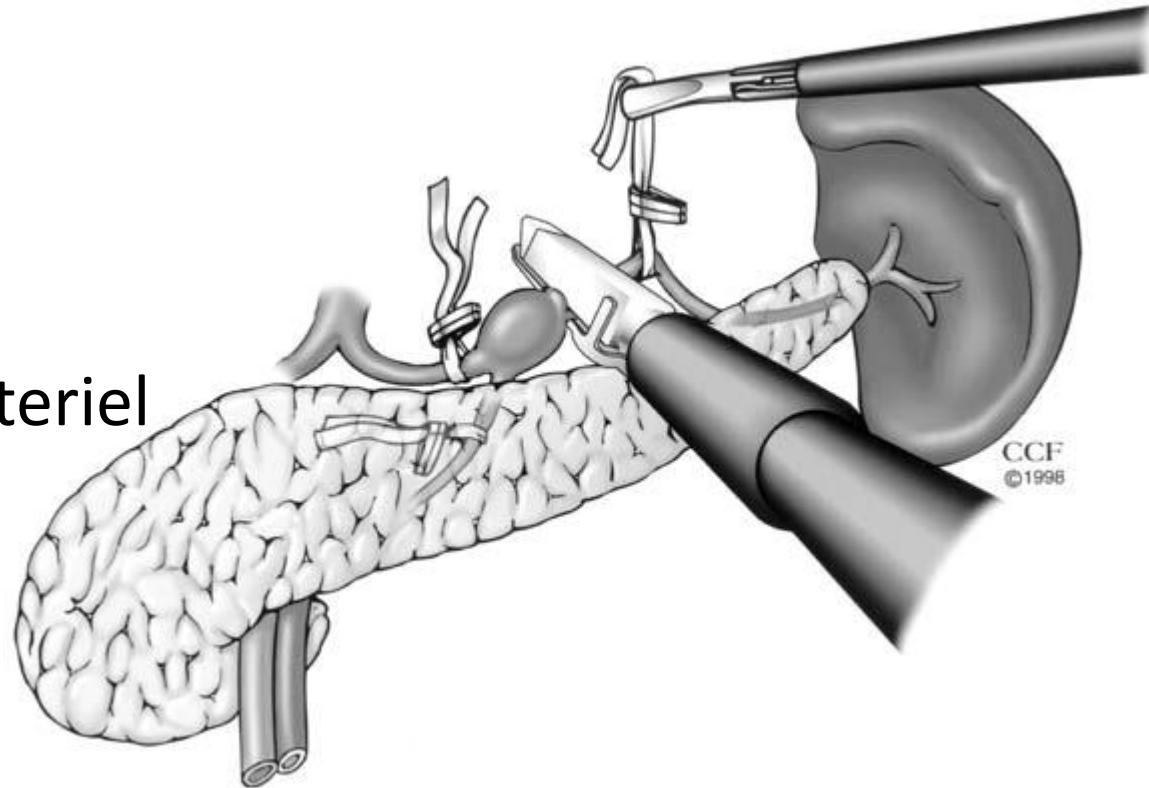

Recommended criteria for invasive intervention for SAA			
	Recommendation	Strength of recommendation	Quality of evidence
2.1	We recommend emergent intervention for ruptured SAAs.	1 (Strong)	A (High)
2.2	We recommend treatment of nonruptured splenic artery pseudoaneurysms of any size in patients of acceptable risk because of the possibility of rupture.	1 (Strong)	B (Moderate)
2.3	We recommend treating nonruptured splenic artery true aneurysms of any size in women of childbearing age because of the risk of rupture.	1 (Strong)	B (Moderate)
2.4	We recommend treating nonruptured splenic artery true aneurysms ≥ 3 cm, with a demonstrable increase in size, or with associated symptoms in patients of acceptable risk because of the risk of rupture.	1 (Strong)	C (Low)
2.5	We suggest observation over repair for small (<3 cm), stable asymptomatic splenic artery true aneurysms or those in patients with significant medical comorbidities or limited life expectancies.	2 (Weak)	C (Low)

SAA

- Tilvækst
 - Langsom vækst 0,2-0,6 mm/år
 - Et fåtal vokser
- Rupturrisiko (n 233)
 - SAA 3,1%
 - SAPA 76,3%
- Mortalitet
 - SAA 25%
 - SAPA 50%
 - Graviditet 80% m / 90% f
- Behandling hvis
 - $\emptyset > 3$ cm
 - Vækst > 5 mm/y
 - Graviditet
 - Portal hypertenseion
- Mayo Clinic 217 patienter, 50% fulgt med serielle skanninger i 75 mdr. Ø 2,1 cm mean, kun 10% vokser, 0,6 mm/år, ingen ruptur eller komplikationer
- Cleveland Clinic 66 patienter, 94% med serielle skanninger gennem 3,1 år, Ø 1,7 cm mean, tilvækst 0,2 mm/år, ingen ruptur eller komplikationer

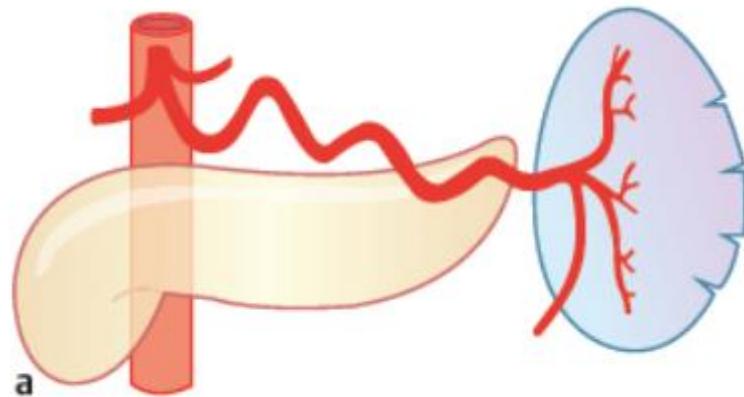

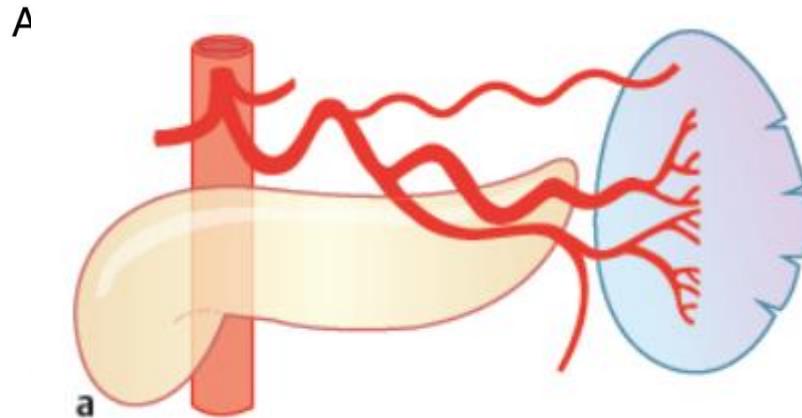

Behandling af SAA

- Splenektomi
- Ligering
- Aneurismektomi
- Transaneurismal arteriel
ligering
- Laparoskopisk
- Endovaskulær

EV - Tekniske overvejelser

- Lokalisation
 - 5% centralt
 - 20% midt
 - 75% perifert
- Anatomি
 - Kollateral forsyning
 - Proptrækker?
- Embolisering
 - Bække sider
- Stentgraft
 - Hvis anatomi tillader

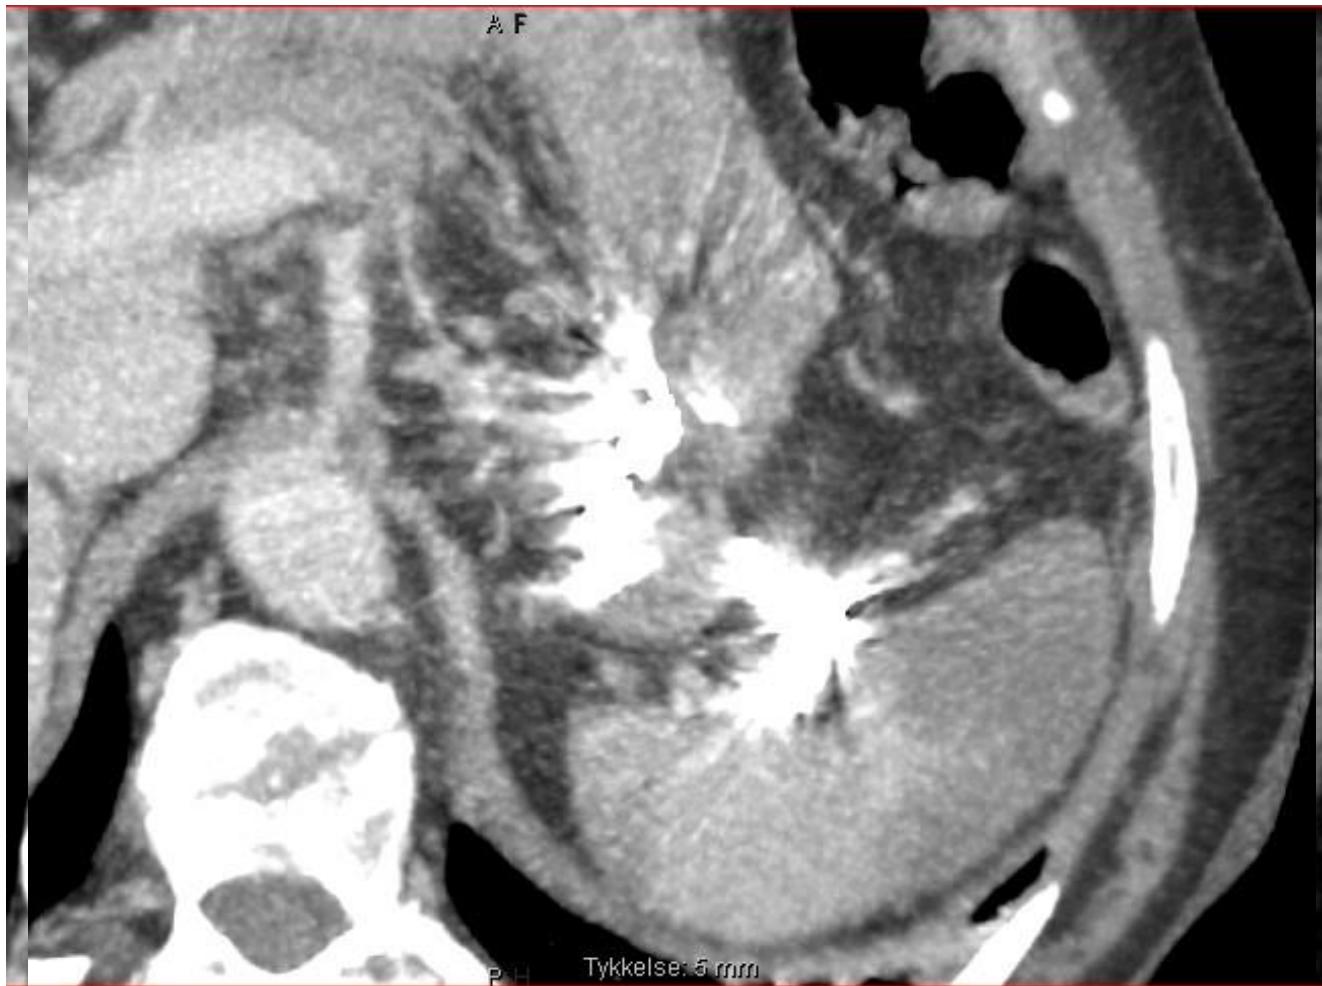

EV-Resultater SAA

Teknisk succes 97% - klinisk succes 98%

- Miltinfarkt
 - Hilært aneurisme (n 6 af 20)
 - Inkomplet kollateral forsyning
 - Nontarget embolisering
- Miltatrofi (2 af 20)
- Pancreatis
- Post embolisering syndrom
- Rekanaliserings (18% - 30%, 1996 og 1998)

Elektivt SAA – 2,5 cm

Leverarterieaneurismen

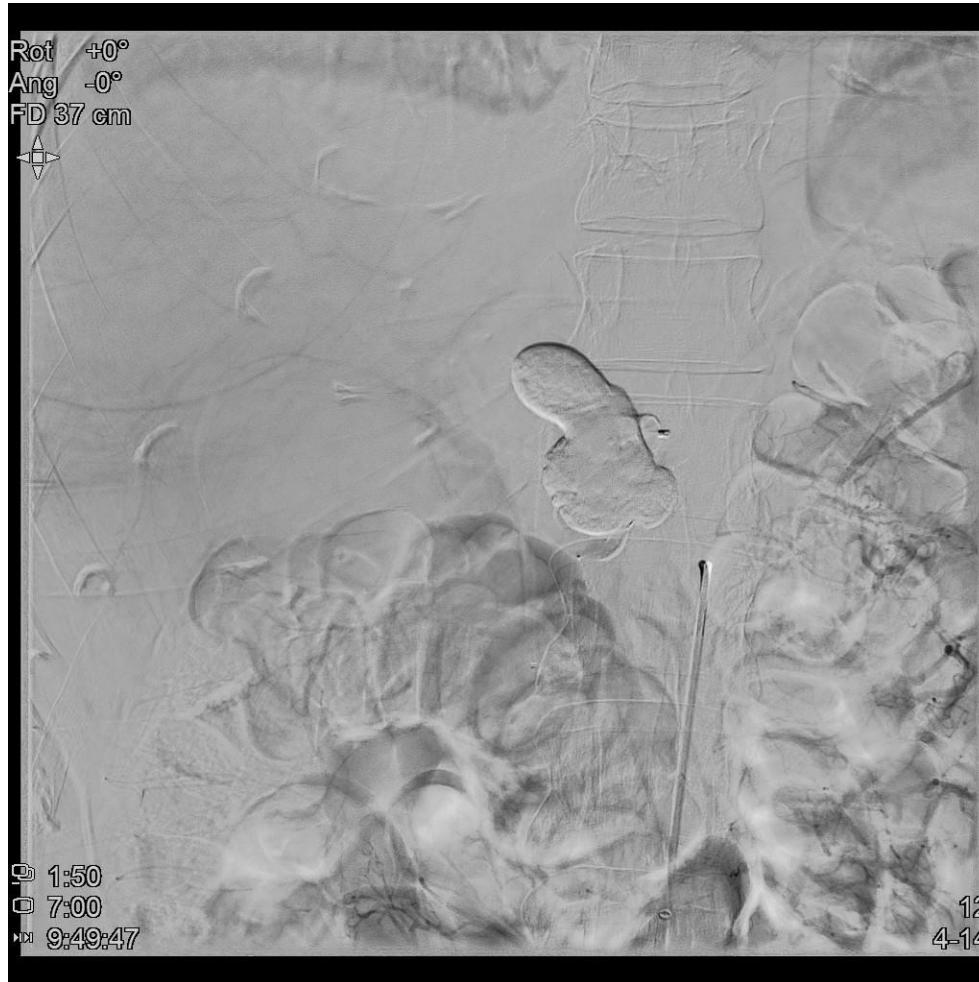

SVS 2020 - 359 HAA

- Tilvækst
 - Op til 8 mm/år
 - 27% af 22 fulgt i 68 måneder vokser
- Rupturrisiko
 - 14-80%?
 - 50 % subgruppe med fibromuskulær dysplasi eller polyarteritis nodosa
- Mortalitet
 - 30%
- Behandlingsgrænse
 - Højrisiko pt $\varnothing > 5$ cm (åben)
 - Lavrisiko pt $\varnothing > 2$ cm (EV)
- 0,002% af 2 mio (Mayo Clinic)
- HAA associeret med
 - SLE, fibromuskulær dysplasi, polyarteritis nodosa, Takayasu arteritis, Wegener granulomatose
- Medfødte årsager til HAA
 - Marfan syndrom, Ehlers-Danlos syndrom Osler-Weber-Rendu syndrom
- 77% ekstrahepatisk
- 20% intra- og ekstrahepatisk
- 3% intrahepatisk

Komplikationer

- Infarkt
- Galdegangsiskæmi
- Galdeblærenekrose
- Abscessdannelse
- Rekanalisering
- Postembolisering syndrom 25%

HAA 4 cm - profylaktisk

Gigantisk HAA – post hæmoragi

Gigantisk HAA

Gigantisk HAA

Hvornår skal RAA behandles?

1297 aneurismer

2. Size criteria and alternative indications for intervention

Recommendations for indications for intervention in RAA			
	Recommendation	Strength of recommendation	Quality of evidence
2.1	In patients with noncomplicated RAA of acceptable operative risk, we suggest treatment for aneurysm size >3 cm.	2 (Weak)	C (Low)
2.2	We recommend emergent intervention for any size RAA resulting in patient symptoms or rupture.	1 (Strong)	B (Moderate)
2.3	In patients of childbearing potential with noncomplicated RAA of acceptable operative risk, we suggest treatment regardless of size.	2 (Weak)	B (Moderate)
2.4	In patients with medically refractory hypertension and functionally important renal artery stenosis, we suggest treatment regardless of size.	2 (Weak)	C (Low)

Ændring i behandlingsgrænse hos asymptotiske RAA

Tidligere

- Tilvækst
 - 16 mm/år
- Rupturrisiko
 - 14-30%
- Mortalitet
 - 80%
- Behandlingsgrænse
 - 2 cm

Aktuelt

- Tilvækst
 - 0,06-0,6 mm/år
- Rupturrisiko
 - 3-5%
- Mortalitet
 - 10% < VAA
- Behandlingsgrænse
 - 3 cm

The contemporary management of renal artery aneurysms

Jill Q. Klausner, BS,^a Peter F. Lawrence, MD,^a Michael P. Harlander-Locke, MPH,^a Dawn M. Coleman, MD,^b James C. Stanley, MD,^b and Naoki Fujimura, MD,^c for the Vascular Low-Frequency Disease Consortium, *Los Angeles and Stanford, Calif; and Ann Arbor, Mich*

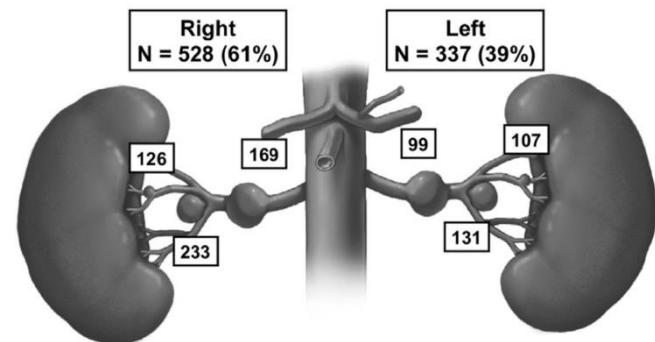

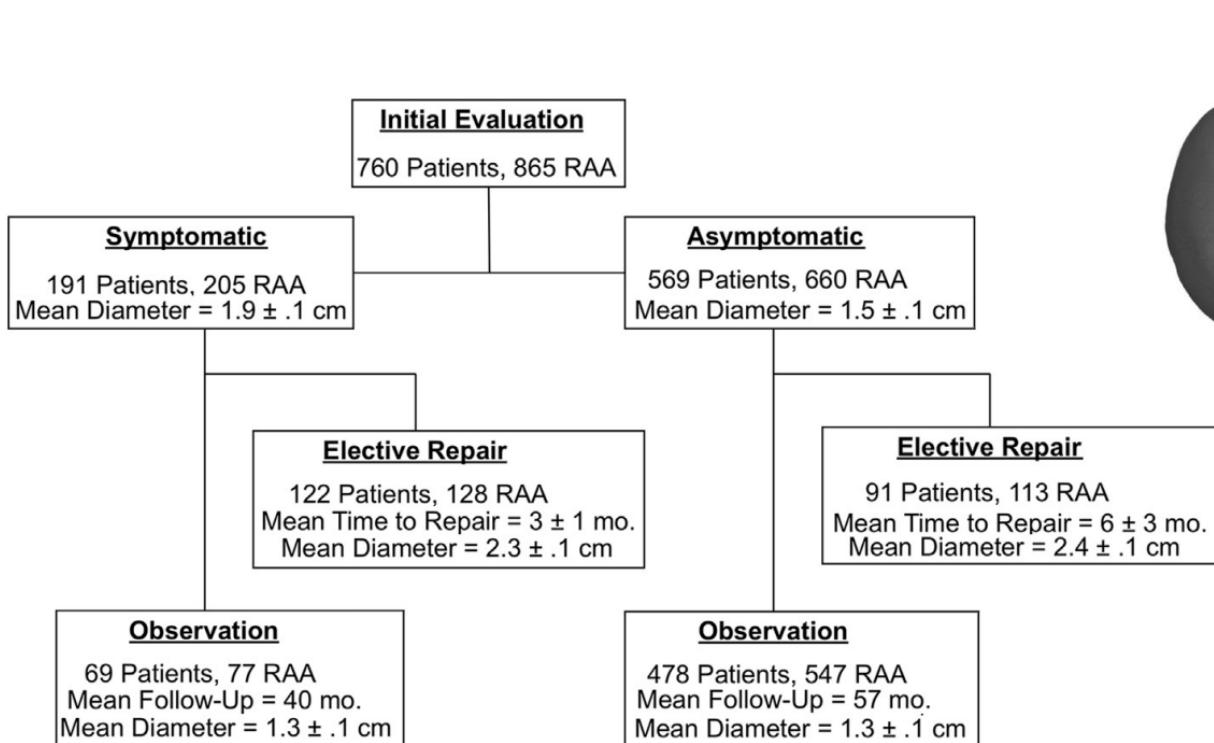

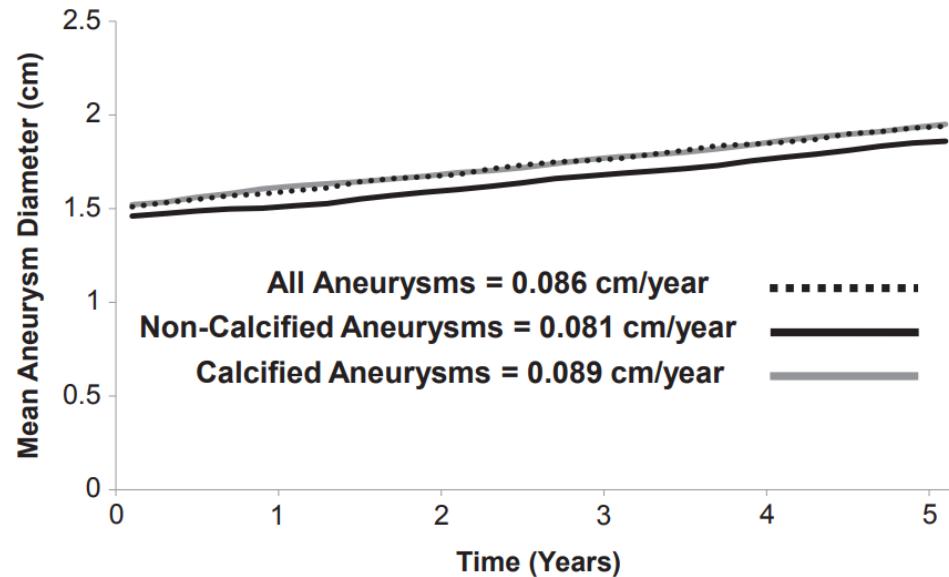

Fig 2. Management used for patients with renal artery aneurysms (RAAs).

Debutsymptomer

Table II. Presenting symptoms

<i>Symptoms</i>	<i>Patients (N = 760), No. (%)</i>
Asymptomatic	569 (75)
Difficult-to-control hypertension	76 (10)
Flank pain	46 (6)
Hematuria	30 (4)
Abdominal pain	15 (2)
Other (back pain, etc)	24 (3)

Vækstrate hos asymptotiske

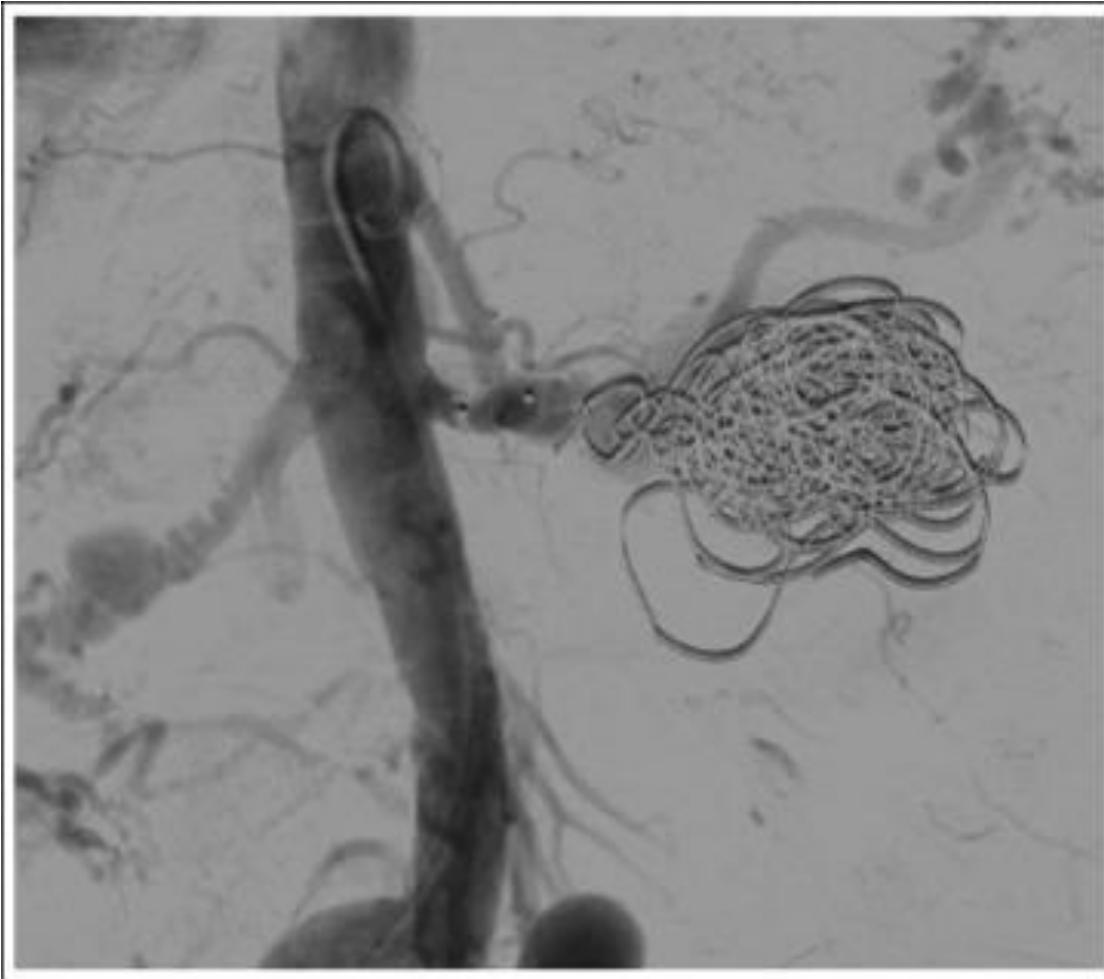

- 454 aneurismmer FU samme modalitet
- 293 aneurismmer uden tilvækst
- Aneurismmer subgruppe > 2 cm
 - Vækst 0,2 cm/y – ikke signifikant forskellig

Ruptur

- Ingen ruptur i opfølgningsgruppen
- 3 patienter debuterede med ruptur
- Rupturraten
 - Totalt 0,3% (3/865 RAA)
 - $\emptyset > 3$ cm 18% (3/17 RAA)

Hvordan behandle RAA?

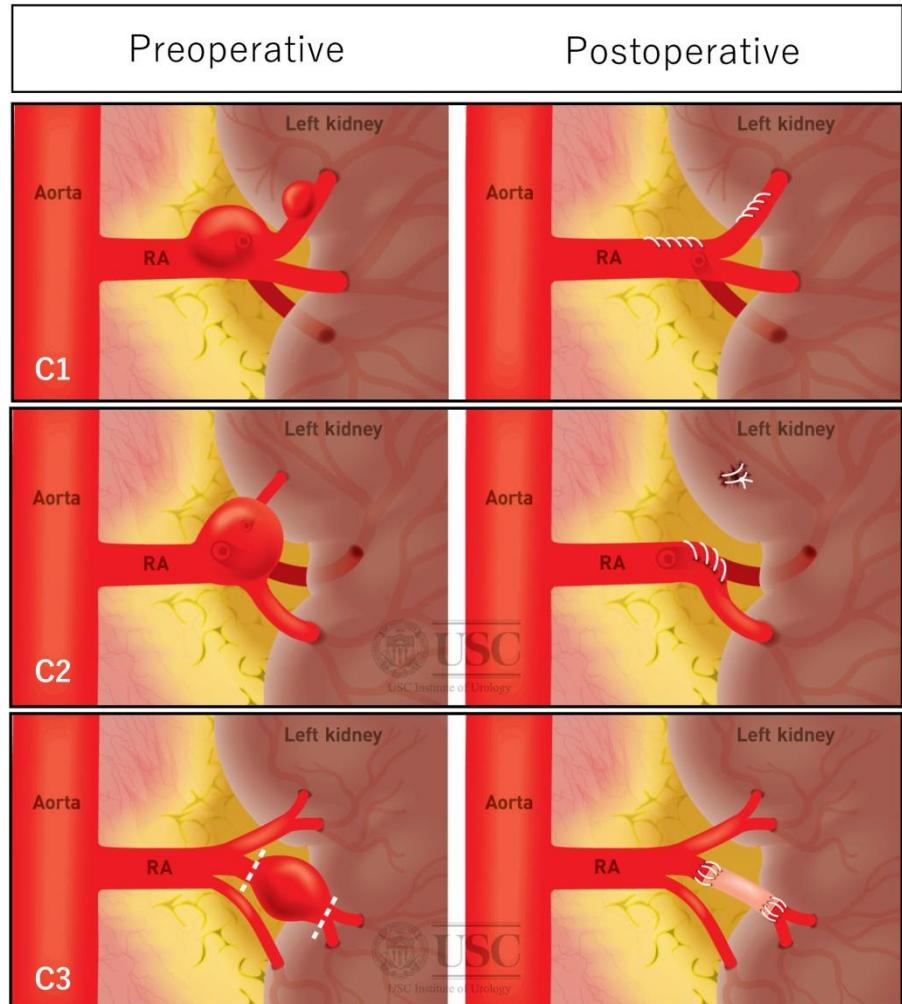

Medicinsk behandling

- Antihypertensiva
 - Kirurgisk behandling til RAA < 3 cm kan overvejes hvis blodtrykskontrol er vanskelig
- Pladehæmmer behandling
- Statin behandling

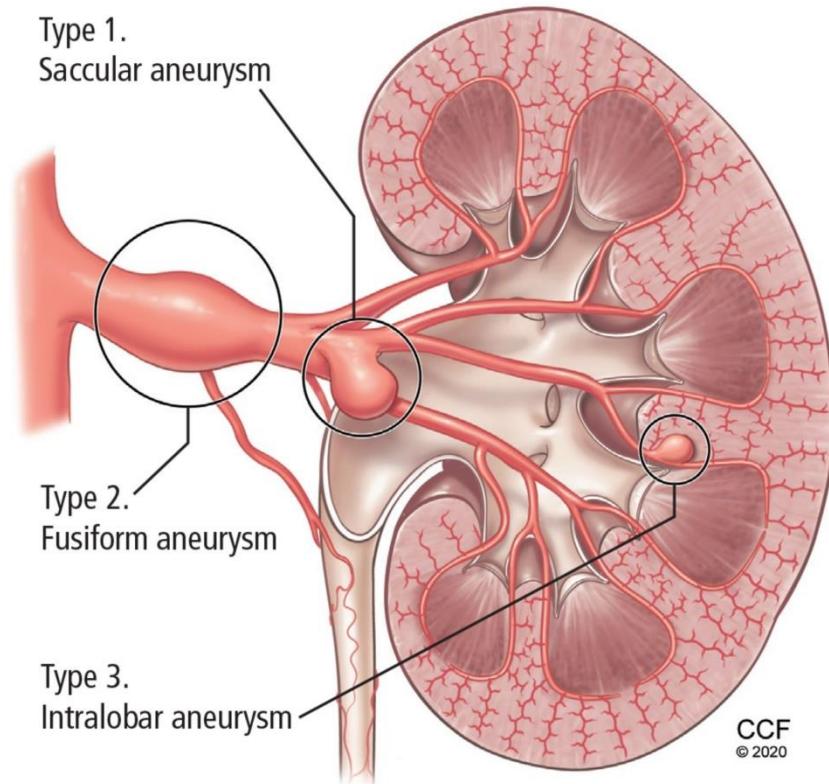

Kirurgisk behandling

- Aneurismektomi
- Arterioraphi
- Ex vivo repair
 - Cold perfusion
- Nefrektomi
- Robotassisteret laparoskopisk repair

Endovaskulær behandling

- Afhængig af lokalisation
 - Hovedgren
 - Binyre, urethra
 - Hilus
 - Delingssted
 - Parenchym
 - Endearterier
- Afhængig af formen
 - Sacculat
 - Fusiformt

Tom Kai Ming Wang, and Milind Y. Desai CCJM
2020;87:755-758

Tilfældigt fundet RAA

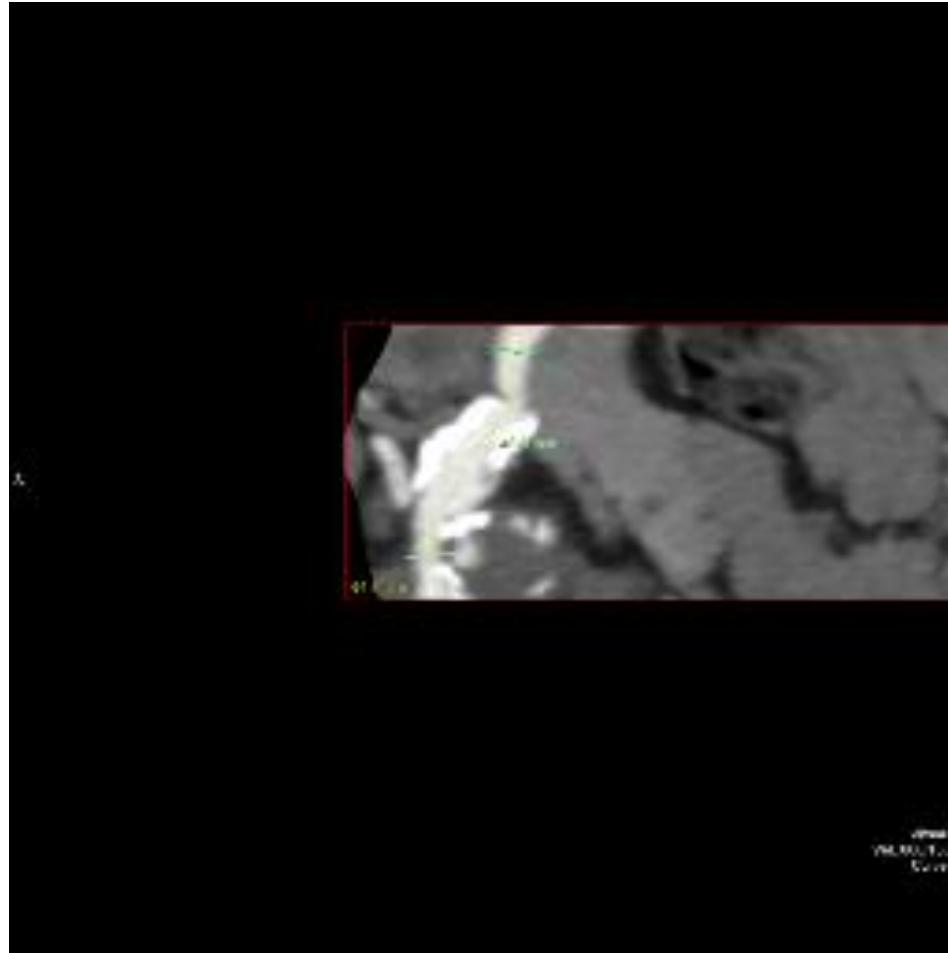

Truncus coeliacus aneurismer

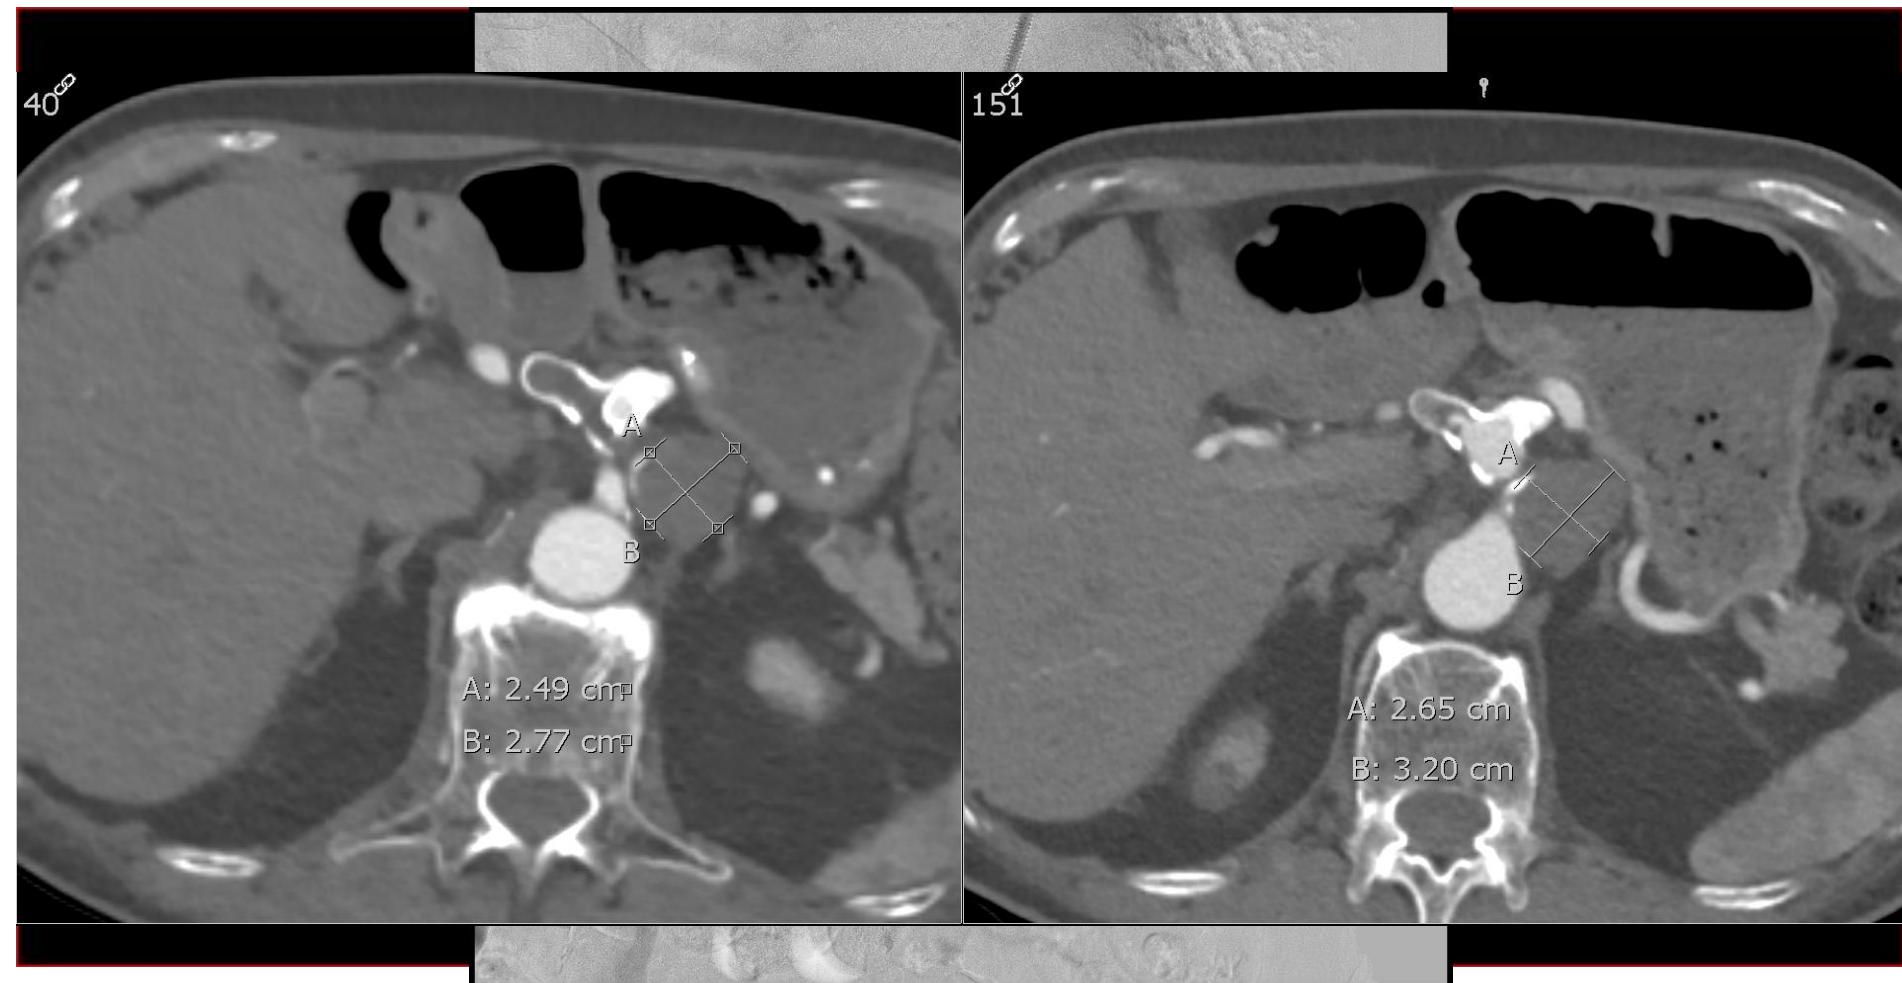

SVS 2020 - 87 CAA

- Tilvækst
 - 1 ruptur blandt 8 asymptotiske CAA fulgt i 91 mdr, ingen væskt af nonrumperede
- Rupturrisiko
 - Samlet 10-20%
 - Ø 15-22 mm 5%
 - Ø > 32 50-70%
- Mortalitet
 - Næsten 100% (33 af 34, 1943)
- Behandlingsgrænse
 - CAA Ø > 2 cm (asymptotiske)
- Spontan dissektion transformeres sjældendt til aneurisme i viscerale arterier – ingen rekomendation
- Poststenotisk dilatation pga MALS behandles konservativt hvis asymptotisk
- CAPA oftere symptomatiske
 - 80% af 28 CAPA
 - 20% af 20 CAA
- Højere 30d-mort v symp

Treatment of Visceral Artery Aneurysms Using Novel Neurointerventional Devices and Techniques

Timothy Éanna Murray, MB, MCh, MRCS, FFR, EBIR,

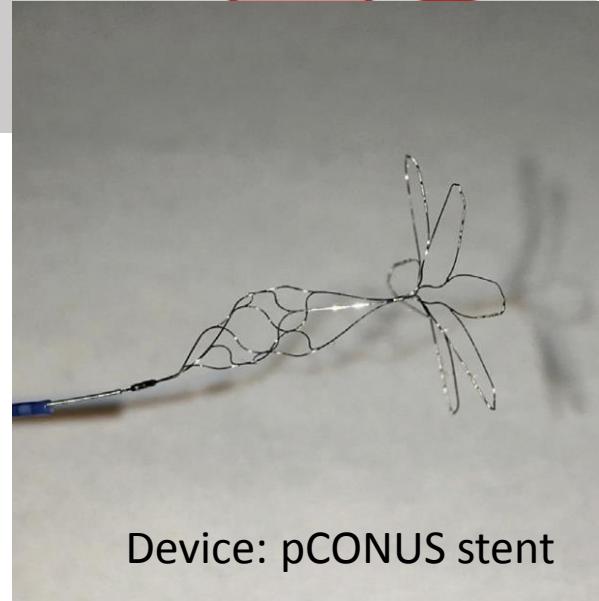

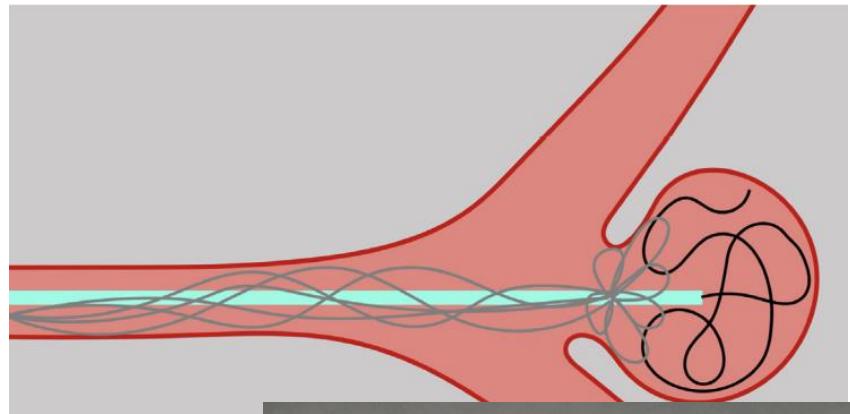

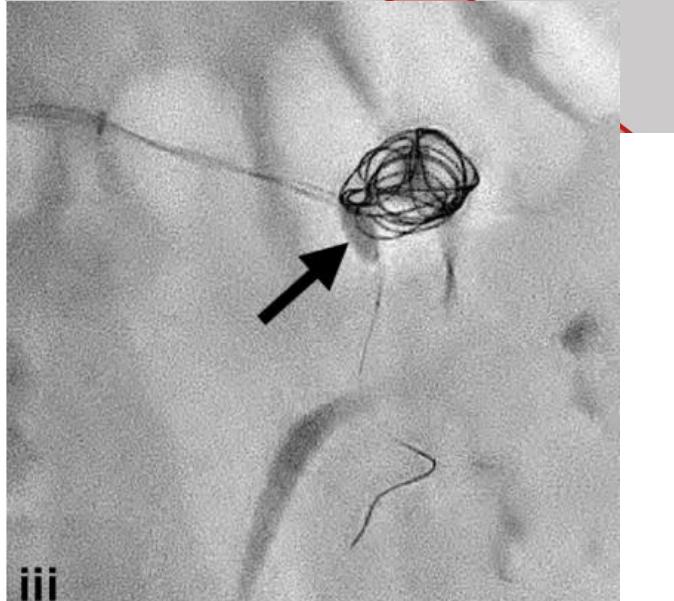

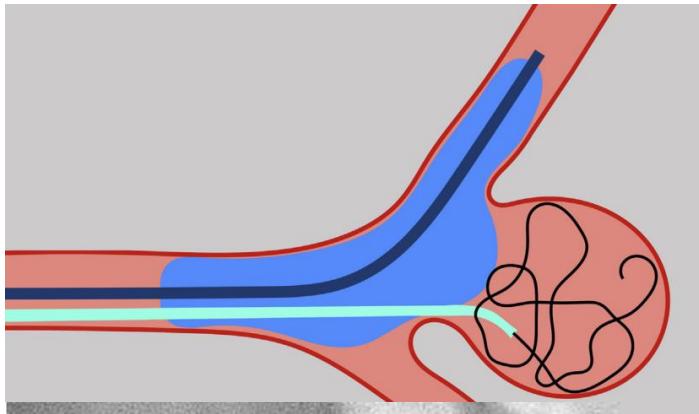

Device: Comaneci

Technique: Temporary stent assisted embolization

Ballon assisteret embolisering

Stent assisteret embolisering

Endovascular Treatment of Visceral Artery Aneurysms and Pseudoaneurysms in 100 Patients: Covered Stenting vs Transcatheter Embolization

- 51VAA 49 VAPA
- CS principelt førstevalg
- Kort afstand fra aorta og ikke-slyngede kar taler for CS
- Oversizer med 1 mm
- CS Ø 5-9 mm
- Hvis kar Ø < 5,5 mm distalt benyttes coronare stentgrafts
- 70 TAE
- 30 CS
 - VAA 24, VAPA 6
 - 19 elektive, 11 akutte
 - 27 Viabahn, 3 coronare
 - 1 22pt, 2 5pt, 3 2pt
 - Patency
 - 6 mdr 88%
 - >3 år 40%

Table I. Patients Undergoing Transcatheter Embolization or Covered Stenting for Visceral Artery Aneurysms.^a

	Total Cohort (n=100)	Transcatheter Embolization ^b (n=70)	Covered Stenting ^b (n=30)
Age, y; men	59±14; 58	59±14; 39	59±15; 19
Aneurysm type	51 VAA, 49 VAPA (39 postsurgical, 5 posttraumatic, 5 postinflammatory)	34 VAA, 36 VAPA	17 VAA, 13 VAPA
Aneurysm size, mm	23±12	23±12	26±12
Affected arteries; sites	31 SA, 21 HA, 14 RA, 12 SMA, 11 GDA, 8 PDA, 3 LGA; 34 proximal, 33 middle, 33 distal	21 SA, 12 HA, 8 RA, 12 SMA, 6 GDA, 8 PDA, 3 LGA; 20 proximal, 23 middle, 27 distal	10 SA, 9 HA, 6 RA, 5 GDA; 14 proximal, 10 middle, 6 distal
Procedure	59 elective, 41 emergency	39 elective, 31 emergency	20 elective, 10 emergency
Technical success	96 (96)	67 (96)	29 (97)
Clinical success	83 (83)	57 (81)	26 (87)
Failure/reinterventions	15 (15)	12 (17)	3 (10)
Major complications	4 (4)	3 (4)	1 (3)
Thirty-day mortality	7 (7) ^c	5/70 (7)	2/30 (7)
Vessel preservation	36 (36)	12 (17)	24 (80)
Target organ ischemia	27(27)	23 (33) ^d	4 (13)
Subgroup SA, HA, RA, and GDA ^e			
Technical success	79/81 (97)	50/51 (98)	29/30 (97)
Clinical success	67/81 (83)	41/51 (80)	26/30 (87)
Failure/reinterventions	12/81 (15)	9/51 (18)	3/30 (10)
Major complications	3/81 (4)	2/51 (4)	1/30 (3)

Abbreviations: GDA, gastroduodenal artery; HA, hepatic artery; LGA, left gastric artery; PDA, pancreaticoduodenal artery; RA, renal artery; SA, splenic artery; SMA, superior mesenteric artery; VAA, visceral artery aneurysm; VAPA, visceral artery pseudoaneurysm.

^aContinuous data are presented as the means ± standard deviation; categorical data are given as the counts (percentage).

^bCombined techniques: 5 covered stenting patients required concomitant embolization of efferent vessels, 1 covered stenting failure needed subsequent embolization, and 4 embolization failures had subsequent covered stenting. Five embolization patients required hematoma drainage and 1 covered stenting patient underwent stent-graft removal and hematoma drainage.

^cOne elective, 6 emergency.

^dOne clinically relevant.

^ePatients with SA, HA, RA, or GDA aneurysms suitable for treatment with either technique.

Systematic Review and Single-Center Experience for Endovascular Management of Visceral and Renal Artery Aneurysms

Hong Kuan Kok, FFRRCSI, FRCR, EBIR, Hamed Asadi, MD, PhD, FRANZCR,
Mark Sheehan, MRCS, Mark F. Given, FFRRCSI, EBIR, and
Michael J. Lee, FFRRCSI, FRCR, EBIR

- 939 pt
- 22 studier inkluderet i perioden 2005-2016
 - Antal patienter pr. studie n 4-63
 - Forfatteres lokale erfaring n 19 (1999-2015)
- 646 (84,5%) endovaskulært behandlede:
 - VAA 432
 - VAPA 151
 - Uklassificerede 63

Aneurisme "demografi"

- Størrelse
 - VAA 28,8 +/- 8,4 mm
 - VAPA 29,6 +/- 16,5 mm
- Ruptur ved præsentation
 - 103/646 (15,9%)
- Emboliseringsmateriale
 - Coils, stentgrafts 13, NBCA 5, plugs 5, thrombin 4, flow diverting stents 3, EVAC 2, partikler 1

Samlede resultater

- Teknisk succes 93,2%
- Organ bevaret 99,3%
- Komplikationer 118 (18,2%)
 - 65 klinisk insignif. infarkt (47 milt, 8 nyre, 3 lever)
 - 11 adgangskomplikationer (10 hæmatom, 1 PA)
 - 23 major complications (blødning, cardielle/cerebrale events, blødning, infarkt, infektion, absces)
 - 10 patienter døde indenfor 30 dage
 - 4 under behandling, 4 efter behandling, IC blødning, lever/nyresvigt
- Kun 4 studier rapporterer efter SIR

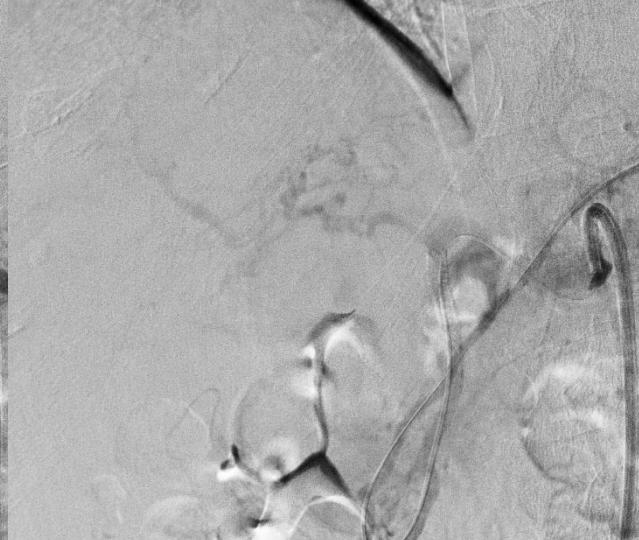

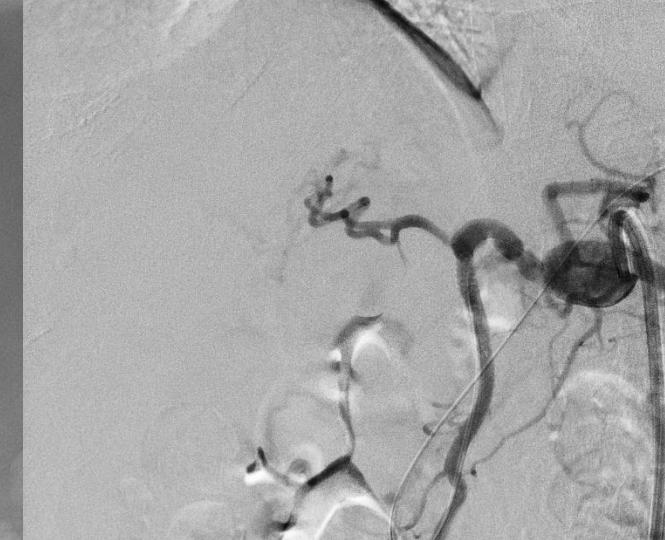

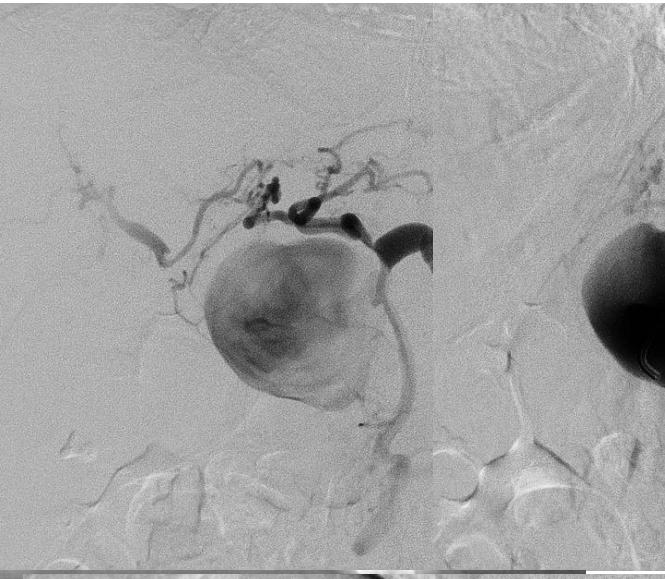

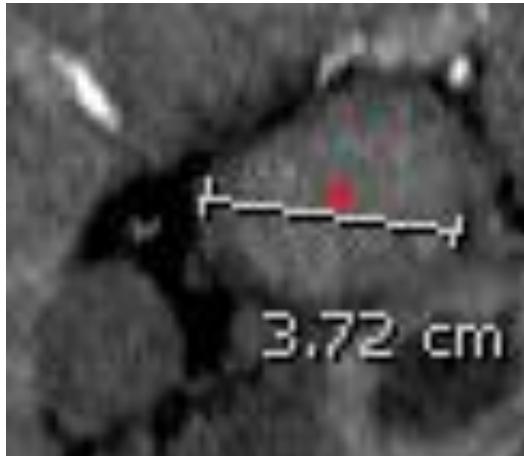

Follow-up – 20,5 mdr.

- 35 (5,4%) reperfusion, endoleak, vækst, sen reblødning
- 3 asymptomatisk thrombose
 - 2 stentgraft, 1 flowdiverter
- 1 stentgraft migrering => reintervention
- 1 nyt aneurisme ved follow-up, progression?

Reintervention

- < 30 d + > 30 d: 4,6%
- > 30 d: 4,1% 27 reinterventioner op til 24 mdr
 - Aneurisme reperfusion eller reblødning
- 3 cases (0,5%) kirurgisk intervention
 - HAA vækst trods EV reintervent
 - RAA perfusion trods EV behandlingsforsøg
 - Pancreas PA to emboliseringsforsøg

HAA – størrelse?

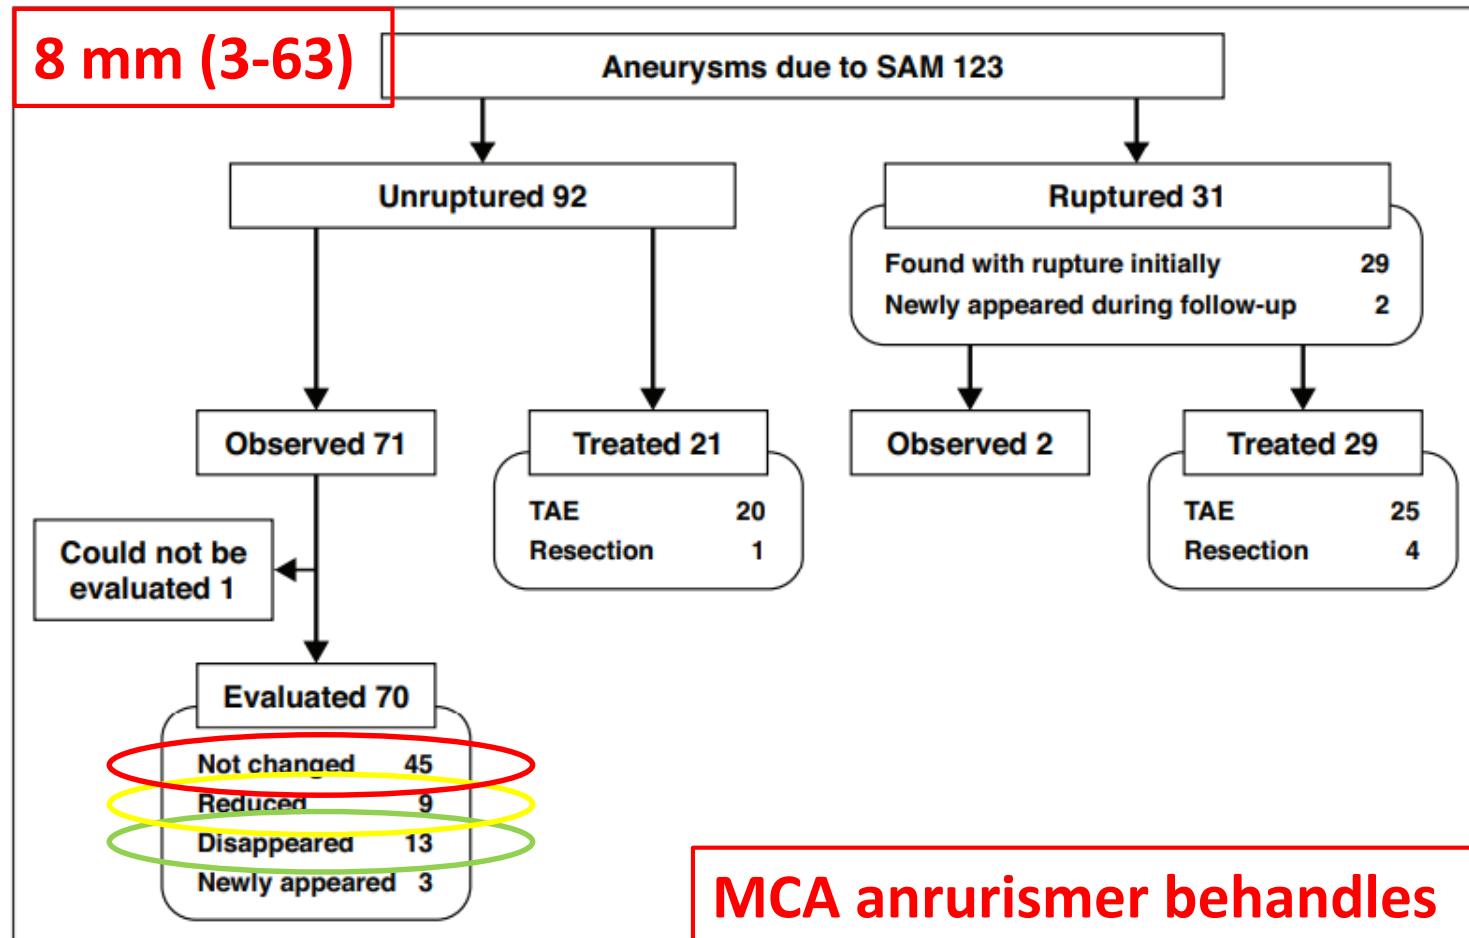

SAM

Sim sAlabiM salaBam Saladu SaladiM

- Kan aneurismer forsvinde?
- SAM
 - Non-atherosklerotisk
 - Non-inflammatorisk
- Billeddiagnostisk
 - Multible fusiforme aneurismer
- Prædilektion for viscerale arterier
- Vacuoler ydre media*
- Diagnostiske kriterier
 - CAA, SMAA, IMAA**
 - Alder > 20 år
 - Fravær af symptomer fra
 - Kropsbygning
 - Hud
 - Led
 - Øjne
 - Lunger
 - Nyrer
 - \div iso RAA (\div fibmuskdysp)
 - Ingen TC stenose

SAM

Segmental Arteriel Mediolyse

Konklusion

- Sande, asymptotiske, non-inflammatoriske, aneurismer hos ikke-gravide vokser i de fleste tilfælde langsomt og forudsigeligt
- Nogle få tilfælde af non-inflammatoriske, non-atherosklerotiske aneurismer udløst af SAM kan regrediere
- Resten skal behandles uanset størrelse
- Blødende aneurismer skal behandles med det samme
- Endovaskulær behandling – hvad ellers?
